

Type 2 Diabetes Mellitus (T2DM) in adults

A guide for South East London Primary Care

Key messages

1. Lifestyle: If overweight, agree a weight loss goal of 5-10% of body weight
2. Blood pressure: Target BP $\leq 140/90$ mmHg
3. Cholesterol: Initiate statin if QRISK2/3 $\geq 10\%$ or history of CVD
4. Optimise HbA1c: Target ≤ 53 mmol/mol ($\leq 7\%$)

Personalise all targets considering e.g. age, co-morbidities and frailty

Why focus on T2DM in SEL?

Common

There are approximately 100,000 people with T2DM in SEL.

Hidden Prevalence

Approximately 30,000 to 40,000 patients in SEL are living with T2DM but have not yet been diagnosed and are not receiving care.

Health Inequalities

T2DM disproportionately affects those from deprived households, Black African, Black Caribbean and Asian communities.

Preventable and treatable

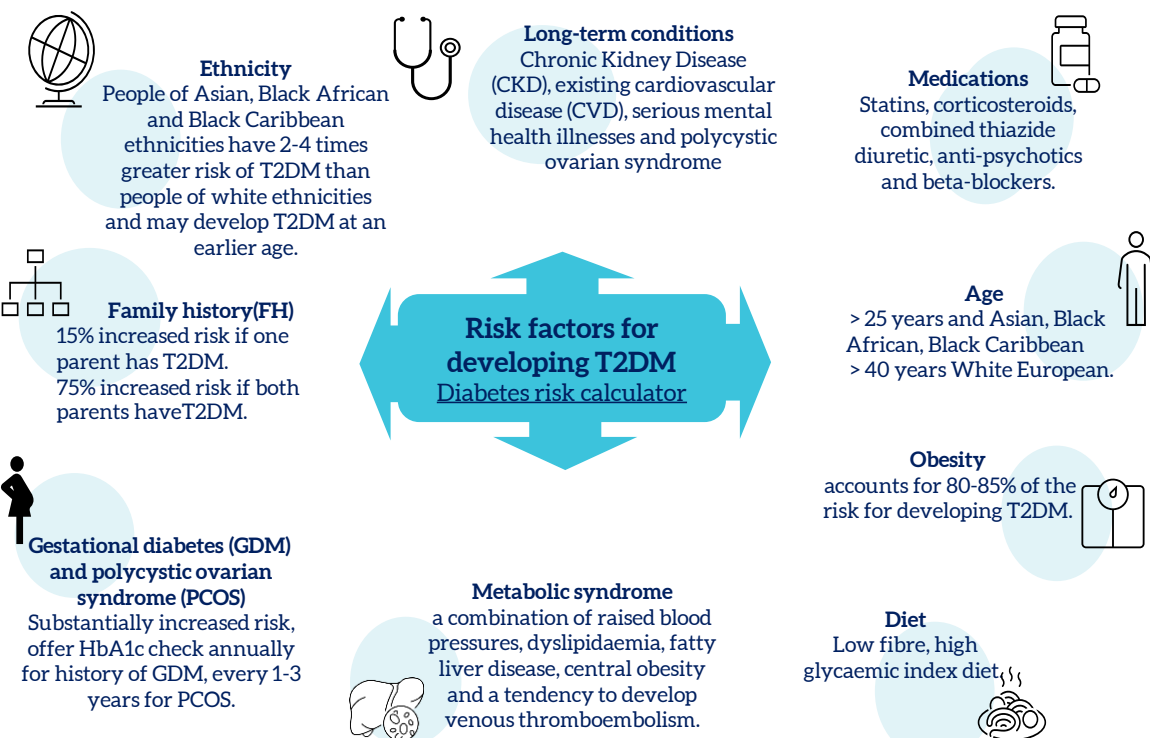

Achieving a healthy blood pressure, cholesterol and HbA1c levels (the triple target) reduces T2DM complications and improves life expectancy.

Early onset T2DM

In SEL, there is a high rate of early-onset T2DM (diagnosed before 40 years), which is more prevalent among ethnic minorities, particularly South Asian communities, and in the most deprived areas. Early-onset T2DM tends to be more aggressive, leading to worse outcomes, and is often linked to unmet psychological and social needs.

New treatments

With a growing number of diabetes medication options, it can be difficult to determine the best treatment options for your patients. [This guide helps your medication choices.](#)

Support understanding

Code

Refer/signpost to education

Follow up

New diagnosis of non-diabetic hyperglycaemia (NDH or pre-diabetes)

Help patients and caregivers understand the diagnosis, its implications, and how to manage their own care. Offer written materials and online resources.

Use Ardens pre-diabetes clinical template

Self-referral to [Healthier You - National Diabetes Prevention Programme \(NDPP\)](#)

- 9-month programme, face-to-face or digital, provided in SEL by Thrive Tribe.
- Share the NDPP link, patient's NHS no, HbA1c result with date of test (set up an Accurx message).

Signpost to [Diabetes UK Advice on Pre-diabetes](#)

Consider local lifestyle support programmes such as [weight management or exercise-on-prescription](#), tailor to individual preferences and circumstances.

Offer annual review.

HbA1c + [Vital5](#): BP, BMI, smoking status, mental health and alcohol intake

New diagnosis of T2DM

Use Ardens diabetes clinical template

Encourage self-referral to [Diabetes Book & Learn](#) to choose from a range of face-to-face or online education programmes e.g. DESMOND and HEAL-D. See Page 16 for more detail.

Share information from [Diabetes UK](#)

Explain annual review process: [eight care processes \(8CP\)](#) plus retinal screening. Assess risk of developing a [diabetic foot problem](#). Arrange 1st appointment for full review.

Seek advice of specialist diabetes accredited clinician/team if considering alternative diabetes diagnosis. See [World Health Organisation Guide](#).

RED FLAG: Weight loss and new T2DM >60 years- 2WW referral for [suspected cancer of pancreas](#) or urgent CT pancreas if available.

Early onset Type 2 diabetes: <40years, associated with poorer outcomes, deprivation, social and psychological problems, black and Asian ethnicities. Aim for tight HbA1c control and offer flexible access to care. Training available [here](#).

Slowly evolving immune mediated diabetes of adults (SEIMs): Relatively low BMI. Subset of Type 1, often misclassified as Type 2, usually needs insulin within 1-5 years. Previously called latent autoimmune diabetes in adults (LADA)

Maturity onset diabetes of the Young (MODY): Not obese, usually < 25 years. Often misclassified as Type 1 or 2. Dominantly inherited: FH of diabetes in multiple generations at a young age. [Guidelines for Genetic Testing in MODY // Diabetes](#)

Ketosis-prone diabetes: Presents with ketosis/prone to DKA, requiring insulin but may not need to continue once controlled. Increased prevalence in West African, Afro-Caribbean and Hispanic people and with those a family history of diabetes.

Pancreatic pathology: Trauma, tumour or inflammation that impacts on pancreatic function leading to insulin dependence.

Steroid induced diabetes (SID): Before starting long-term oral steroids (OCS), check HbA1c to rule out pre-existing T2DM, and repeat this during treatment. If SID develops on OCS, record and manage it accordingly. Recheck HbA1c three months after stopping steroids. If HbA1c has returned to normal, record as *diabetes resolved*. If HbA1c remains in the T2DM range, continue to treat and code as T2DM.

Atypical presentation?

Health Inequalities

Health inequalities are avoidable, unfair and systematic differences in health between different groups of people.

Learning Disabilities (LD)

People with learning disabilities (LD) tend to develop T2DM at a younger age and are less likely to receive regular checks. Include an HbA1c in the annual health check review for patients at risk of T2DM.

Consider making reasonable adjustments, such as:

- Ensure you and your colleagues are trained and confident in supporting individuals with LD, (e.g. [Oliver McGowan training](#)).
- Offer extended appointment times.
- Involve both the patient and their carers in treatment decisions.
- Provide easy-read materials, available from [Diabetes UK Resources for LD](#).

Severe Mental Illness (SMI)

- SMI increases the risk of developing T2DM.
- SMI is linked to poverty, homelessness, incarceration, social isolation and unemployment, contributing to poor medication adherence and missed appointments.
- Include HbA1c in your annual SMI health checks and offer flexible access
- Diabetes increases the likelihood of depression - see CESEL [Depression & Anxiety](#) Guide.
- Screen for mental health issues in annual diabetes review.

Deprivation

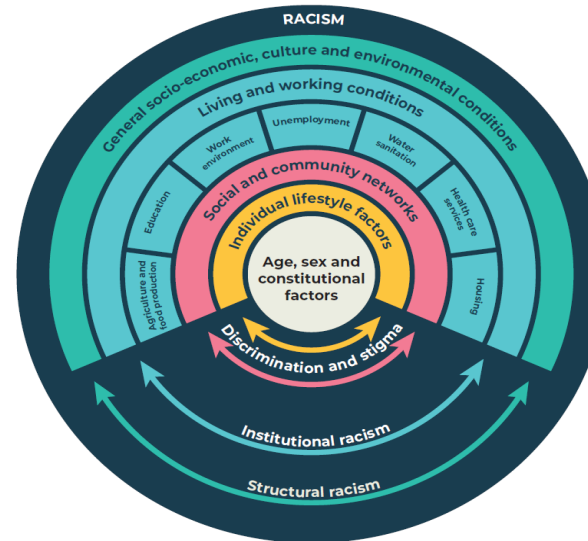

- Diabetes is 40% more common in people from the most deprived communities, with higher rates of complications and risk of death.
- This increased risk is associated with obesity, lack of physical activity, unhealthy diet and poor blood pressure control.
- Aim for a flexible access offer - to meet the needs of your most deprived patients.

Sickle Cell Disease (SCD)

People living with both SCD and T2DM are at significantly higher risk of organ damage. Maintaining good disease control is particularly important, and monitoring can be more complex. These patients should receive a specialist assessment that includes a clear plan for T2DM monitoring.

Ethnicity

- **Asian, Black African and Black Caribbean communities** are disproportionately affected by T2DM, with increased prevalence at a younger age and with poorer outcomes.
- Contributing factors include overcrowded houses, poverty, unemployment, limited access to education, and experiences of racism.

*Though social determinants are universal, **racism** is one of a range of driving forces that exists in our societies and that acts on these determinants.'*

[Jones, D. \(2021\). Beyond the conversation about race. Better Health for All](#)

Barriers to effective detection and management of T2DM include:

- Lack of **trust** in health services and professionals.
- Challenges in **accessing services** and **using technology**.
- Healthcare providers often lack an **understanding** of patients' **cultural foods and beliefs**.
- Patients may not understand their T2DM, impacting on compliance and can also feel inundated with excessive information.

How can we tackle health inequalities?

- **Co-design care:** work with your communities and patient groups.
- **Know your data:** use SEL Diabetes dashboards (contact bi@selondonics.nhs.uk for access).
- **Target patient groups** e.g. [Ardens case-finder searches](#)
- **Ask for help:** contact your [CESEL facilitator](#) for support

Team and system actions

- Patients often prefer **face-to-face care**, especially for a new diagnosis of diabetes or pre-diabetes.
- Encourage **self-management**.
- **Undertake cultural humility training**

Individual actions

- Establish trust with patient-centred consultations and shared decision making.
- Offer flexible access, targeted services, community engagement, contact in patients' 1st language.
- Signpost to culturally appropriate support.
- Acknowledge that patients may have experienced racism in healthcare services.

Through this guide

- We signpost to culturally helpful diabetes resources.

Personalised care

Structured personalised care – health professionals helping patients become more involved in decisions about their care and goal setting reduces patients' risk of developing complications.

[Personalised Care Institute](#), offers learning modules.

Social Prescribing Link Workers (SPLW) and Care Coordinators can support people to take control of their T2DM.

Goal Setting

Support your patients to make individualised SMART goals, e.g.

SPECIFIC: 'I want to lose weight.'

MEASURABLE: 'I'll aim to lose 2kg.'

ACHIEVABLE: 'I attend a Book and Learn course to help me.'

REALISTIC: 'I'll ask my family to help too.'

TIMED: 'I will do this over the next 6 months.'

See this [short patient video](#) on achieving goals.

Pregnancy planning/contraception

Discuss pregnancy planning and effective contraception in women of childbearing age. See [page 10](#).

Co-morbidities

Consider an aligned contact/appointment for hypertension, CKD, atrial fibrillation and established CVD to improve patient convenience and practice workload. Seek specialist assessment for the management of haemoglobinopathies including sickle cell disease.

Diet

Signpost to healthy eating advice:

[10 tips for healthy eating with diabetes](#) | [Diabetes UK](#)

[The Eatwell Guide: What does it mean for diabetes?](#) | [Diabetes UK](#)

Signpost to culturally appropriate advice e.g. [Diabetes and African and Caribbean foods](#) - [Diabetes Africa](#), [Healthy Eating for South Asians](#) - [Healthy Diet Tips](#).

[Complete CDEP](#) Nutrition learning module to increase your knowledge of diet and T2DM. (South London Teams [click here](#) for access to CDEP).

Physical Activity

Increased physical activity, even without weight loss, brings health benefits. Adults should try to do at least 30 minutes of moderate physical activity on 5 or more days a week.

Use brief advice and agree individualised SMART goals.

- **ASK:** "What physical activities do you enjoy?"
- **ASSIST:** "Can you think of opportunities to introduce activity into your day?"
- **ACT:** Support [SMART goals](#)

[Physical activity infographic for patients](#), [MECC Link](#) with resources.

[Diabetes for exercise](#) | [Type 1 and type 2](#) | [Diabetes UK](#).

Psychological wellbeing

Diabetes distress

Feelings of frustration, defeat and being overwhelmed by T2DM can progress to depression and poor diabetes control. Signpost to e.g. [Diabetes Support Forum](#) | [Diabetes UK](#).

Mood

People with T2DM have higher rates of depression. Explore mood and impact on wellbeing. See [CESEL Depression and Anxiety Guide](#).

Diabetes complications

Ask about and support management of complications:

- Eyesight: offer retinal screening.
- Oral health: check seeing dentist regularly.
- Gastroparesis: associated with erratic glucose control.
- Sexual dysfunction: offer phosphodiesterase type 5 inhibitor to men.
- Neuropathy: offer pain management if needed.
- [Feet](#): see [page 6](#).
- [For hypo and hyperglycaemia](#) see [page 12](#).

Weight management

Weight loss can reverse T2DM, reduce CVD risk, improve glucose control and quality of life. People from Black African, Black Caribbean and Asian family backgrounds are at increased risk of health conditions at a lower BMI than people from a white background. Refer to [Heal-D](#) for culturally tailored support and [see page 16](#) for local pathways.

- Be mindful of the language you use to discuss weight.
- Tailor interventions to people's circumstances, choices and culture.

Signpost to [Calculate your body mass index \(BMI\) for adults](#) - [NHS](#) and to local support See [weight management pathways](#) on [page 16](#)

Individualise all targets, review dates and monitoring Ensure all care processes undertaken at diagnosis and at least annually Include safe drinking and healthy mind for a complete [Vital 5 check](#)

1

Body Mass Index kg/m²

Overweight
BMI ≥ 25 kg/m² white groups, BMI ≥ 23 kg/m² South Asian, Chinese, other Asian, Middle Eastern, Black African or African-Caribbean family background.
If overweight, agree an initial weight loss target of 5–10% of body weight.

2

Blood Pressure

	Targets	
QOF	≤140/90mmHg	excludes moderately or severely frailty
NICE	≤140/90mmHg	≥ 80 years ≤ 150/90mmHg
CKD	If ACR ≥ 70 mg/mmHg	BP ≤130/80 mmHg

QOF and NICE targets 5mmHg lower for home (HBPM) and ambulatory monitoring (ABPM)
See [CESEL Hypertension Guide](#).

3

Cholesterol

Primary prevention: offer statin if QRISK2 or 3 ≥ 10% after trial of lifestyle modification
QOF target excludes those with moderate or severe frailty.
Consider [Lifetime Qrisk](#) for younger patients.
Secondary prevention: offer statin to all patients with established cardiovascular disease (CVD)
[See page 7 for more details.](#)

4

HbA1c

Individualise target especially for reduced life expectancy, risk of falls and/or significant co-morbidities. In younger patients (under 40) aim for especially tight control and check HbA1c more frequently e.g. 3-6 monthly.
Recheck 3 months from medication dose change and 3 monthly until stable, then 6 monthly.
Use [NICE patient decision aid](#) to support discussions.
HbA1c targets for women with T2DM planning a pregnancy/pregnant [see page 10](#)

NICE Targets	≤48mmol/mol (6.5%)	unless taking a drug which can cause low sugars/hypos e.g. gliclazide, insulin
	≤53mmol/mol (7%)	if on a drug that could cause low sugars/hypos and patients with moderate/severe frailty
QOF Targets	≤58mmol/mol (7.5%)	without moderate or severe frailty
	≤75mmol/mol (7.5%)	with moderate or severe frailty

HbA1c should **NOT** be used for monitoring of T2DM in patients with haemoglobinopathies including sickle cell disease. Seek specialist advice.

5

Smoking

Signpost patients to local [Stop Smoking website](#) and [Help with giving up smoking | Diabetes UK](#).
Complete or refresh your learning with [Very Brief Advice Training Elearning Module](#).

6

Renal function and albumin creatinine ratio (ACR)

ACR ≥ 3mg/mmol is clinically significant – early morning sample ideal but not essential.
Check eGFR - <60ml/min consider chronic kidney disease (CKD).
See: [CESEL CKD guide](#) for full details of investigation and managing patients with CKD and T2DM.

7

8

Foot Check: at diagnosis and annual review

LOW RISK Normal examination > annual review with practice team. Emphasis importance of foot care. Low-Risk-Foot.pdf patient leaflet	MODERATE RISK Deformity, neuropathy or absent pulse > Refer to Foot Health Community Clinic. Moderate-Risk-Foot.pdf patient leaflet
HIGH RISK History of ulcer or amputation, neuropathy + absent pulse/callus/deformity, absent pulse + callus/deformity > Urgently Refer to Foot Health Community Clinic. High-Risk-Foot.pdf patient leaflet	ACTIVE DIABETIC FOOT PROBLEM Ulcer/gangrene/limb threatening ischaemia/infection/suspected Charcot arthropathy or unexplained swelling with colour change > Urgent diabetic foot clinic or A&E out of hours

[Handbook: Diabetes footcare in dark skin tones - Diabetes Africa](#)

9

Eye Check – ‘the 9th Care Process’

- Retinopathy screening within 3 months of diagnosis, every 2 years for low-risk patients otherwise annually: More information on SEL service [here](#).
- Coded patients will receive an automatic invite. Check this is happening at annual review.
- Patients may be excluded from screening if they are unable to sit upright, use a chin rest or able to follow instructions.
- Patients can choose to opt out.
- Code if patients do not attend and encourage to attend at their next review.
- Pregnant women with diabetes should be offered eye screening more frequently.
- Use Ardens Diabetes Review template to code all 8CP and retinopathy screening.
- Patient information of SEL service can be found [here](#).

Identify and address modifiable risk factors

Individualise targets & goals,
including for frailty, comorbidities, end of life care

Check understanding,
adherence and set a review date

Summary of Blood pressure management

For detailed hypertension guidance see [CESEL hypertension guide](#) (includes for pregnant women)

Which BP target in T2DM?

NICE	Age <80yrs	≤140/90mmHg	ABPM/HBPM ≤135/85
	Age ≥80yrs	≤150/90mmHg	ABPM/HBPM ≤145/85
	With CKD/ACR ≥70mg/mmol	≤130/80mmHg	Systolic range = 120-129mmHg
QOF	≤140/90mmHg		ABPM/HBPM ≤135/85
	excludes those with moderate or severe frailty		

Summary of Lipid Management in T2DM

Primary Prevention

Assess CVD risk

- Bloods: non-fasting lipid profile, ALT or AST, HbA1c, TSH, renal function
- Recent BP, BMI, smoking status
- Calculate QRISK 2/3,
- [For younger patients calculate Lifetime Orisk](#)
- Patients with familial hypercholesterolaemia and/or CKD should be offered statin regardless of QRISK

Decision to treat

- First offer lifestyle advice see [Cholesterol & Cholesterol levels | HEART UK - The Cholesterol Charity](#)
- Then offer statin if QRISK 2/3 ≥ 10%
- Support patient decision with NICE [Patient decision aid: Should I take a statin?](#)

Starting statins

Offer daily **atorvastatin 20mg OD** (or rosuvastatin 10mg OD)

Calculate baseline non-HDL level (total cholesterol minus HDL cholesterol)

Review at 3 months

Repeat lipids and ALT or AST aiming for **40% reduction in non-HDL cholesterol**

≥ 40% reduction

AST or ALT at 3 months and 12 months only unless clinically indicated.
Review annually: assessing adherence to drugs, diet and lifestyle.

< 40% reduction

Consider up-titration to max dose **atorvastatin 80mg** (or rosuvastatin 20mg).
If intolerant to higher dose, consider adding ezetimibe 10mg daily.
If intolerant to statins start ezetimibe and consider bempedoic acid.

(See [SEL Lipid management SEL Pathways](#))

[Refer to local lipid clinic](#) if not achieving target or intolerance to treatment options.

Secondary Prevention

History of CVD: offer lifestyle advice and **atorvastatin 80mg OD** (or equivalent) or max tolerated dose regardless of cholesterol levels.

Repeat lipid profile at 2-3 months and treat to lipid profile target:

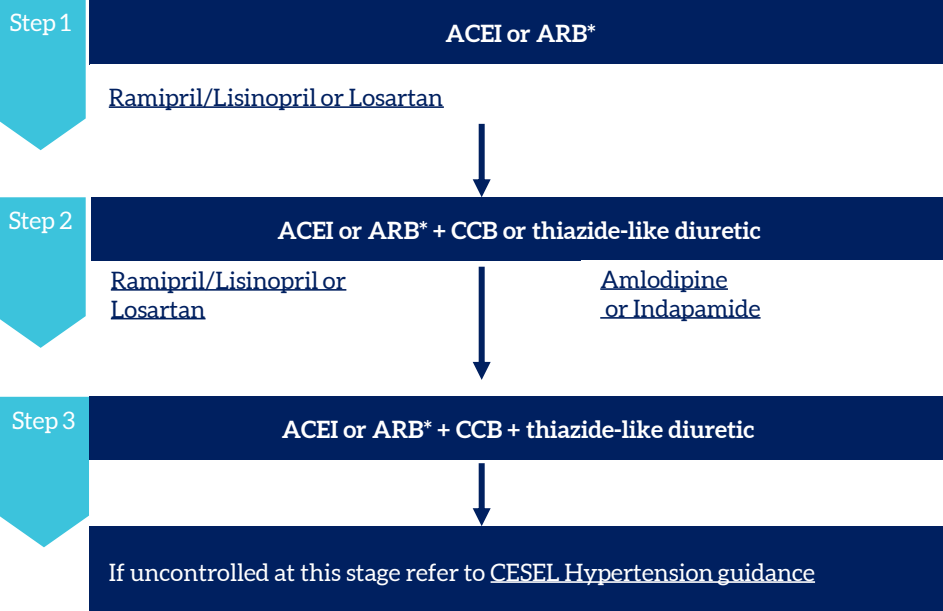

LDL ≤ 2.0 mmol/l or non-HDL ≤ 2.6 mmol/l

Achieved target

Review annually: assessing treatment to target, adherence to drugs and offering support for diet and lifestyle measures

Not achieved target

[See SEL Lipid management SEL Pathways](#)

*For people of Black African or African-Caribbean family origin use ARB instead of ACEI as increased risk of angioedema with ACEI.

For pregnant women or women planning a pregnancy see [CESEL Hypertension guidance](#)

Optimise medication to most effective tolerated dose, and check adherence at each step before stepping up

Identify and address modifiable risk factors

Individualise targets & goals,
including for frailty, comorbidities, end of life care

Check understanding,
adherence and set a review date

Step 1

On initial diagnosis: person centered lifestyle advice

If BMI <22kg/m² or symptomatically **hyperglycaemic** think insulin (seek early/urgent advice from diabetes team).

Agree personalised target, see [NICE patient decision aid](#).

If HbA1c remains ≥ 48 mmol/mol or individually agreed target move to step 2.

HbA1c should **NOT** be used for diagnosis or monitoring of T2DM in patients with haemoglobinopathies including sickle cell disease (SCD). Seek specialist advice (add Ref).

Step 2

Assess HbA1c, kidney function and calculate QRISK 2/3

Not at high CVD risk

QRISK2 or 3 < 10%

High Risk of CVD

QRISK 2 or 3 ≥ 10%

Chronic heart failure (HF) and/or atherosclerotic CVD
(Atherosclerotic CVD includes coronary heart disease, acute coronary syndrome, history of MI, stable angina, coronary or other revascularisation, ischaemic stroke, transient ischaemic attack, peripheral artery disease).

Offer Metformin

Start 500mg (standard release) daily with/after food and increase by 500mg every 2 weeks until on 1g bd (offer slow release if GI side effects)

If metformin is CI or not tolerated, consider DPP-4i or SU or Pioglitazone.

SGLT2 inhibitor monotherapy can be considered if sulphonylurea (SU) and pioglitazone are not appropriate, and a DPP-4 would otherwise be prescribed.
[NICE TA390](#) and [NICE TA572](#)

and consider

SGLT2 inhibitor

canagliflozin, dapagliflozin, empagliflozin are of proven CVD benefit

Start metformin alone to assess tolerability before adding SGLT2i.

If metformin contraindicated/not tolerated start SGLT2i.

Review DKA risk factors before starting an SGLT2i – see [pages 12 and 14](#) and

[SEL Guide for Prescribing SGLT2 Inhibitors in HbA1c Managements in Adults with T2DM](#)

and offer

Recheck HbA1c and QRISK 2/3 at 3 months

If CVD risk or status changes at any point, return to step 2 to as SGLT2 inhibitor may now be indicated

Personalised target achieved

Reinforce lifestyle advice

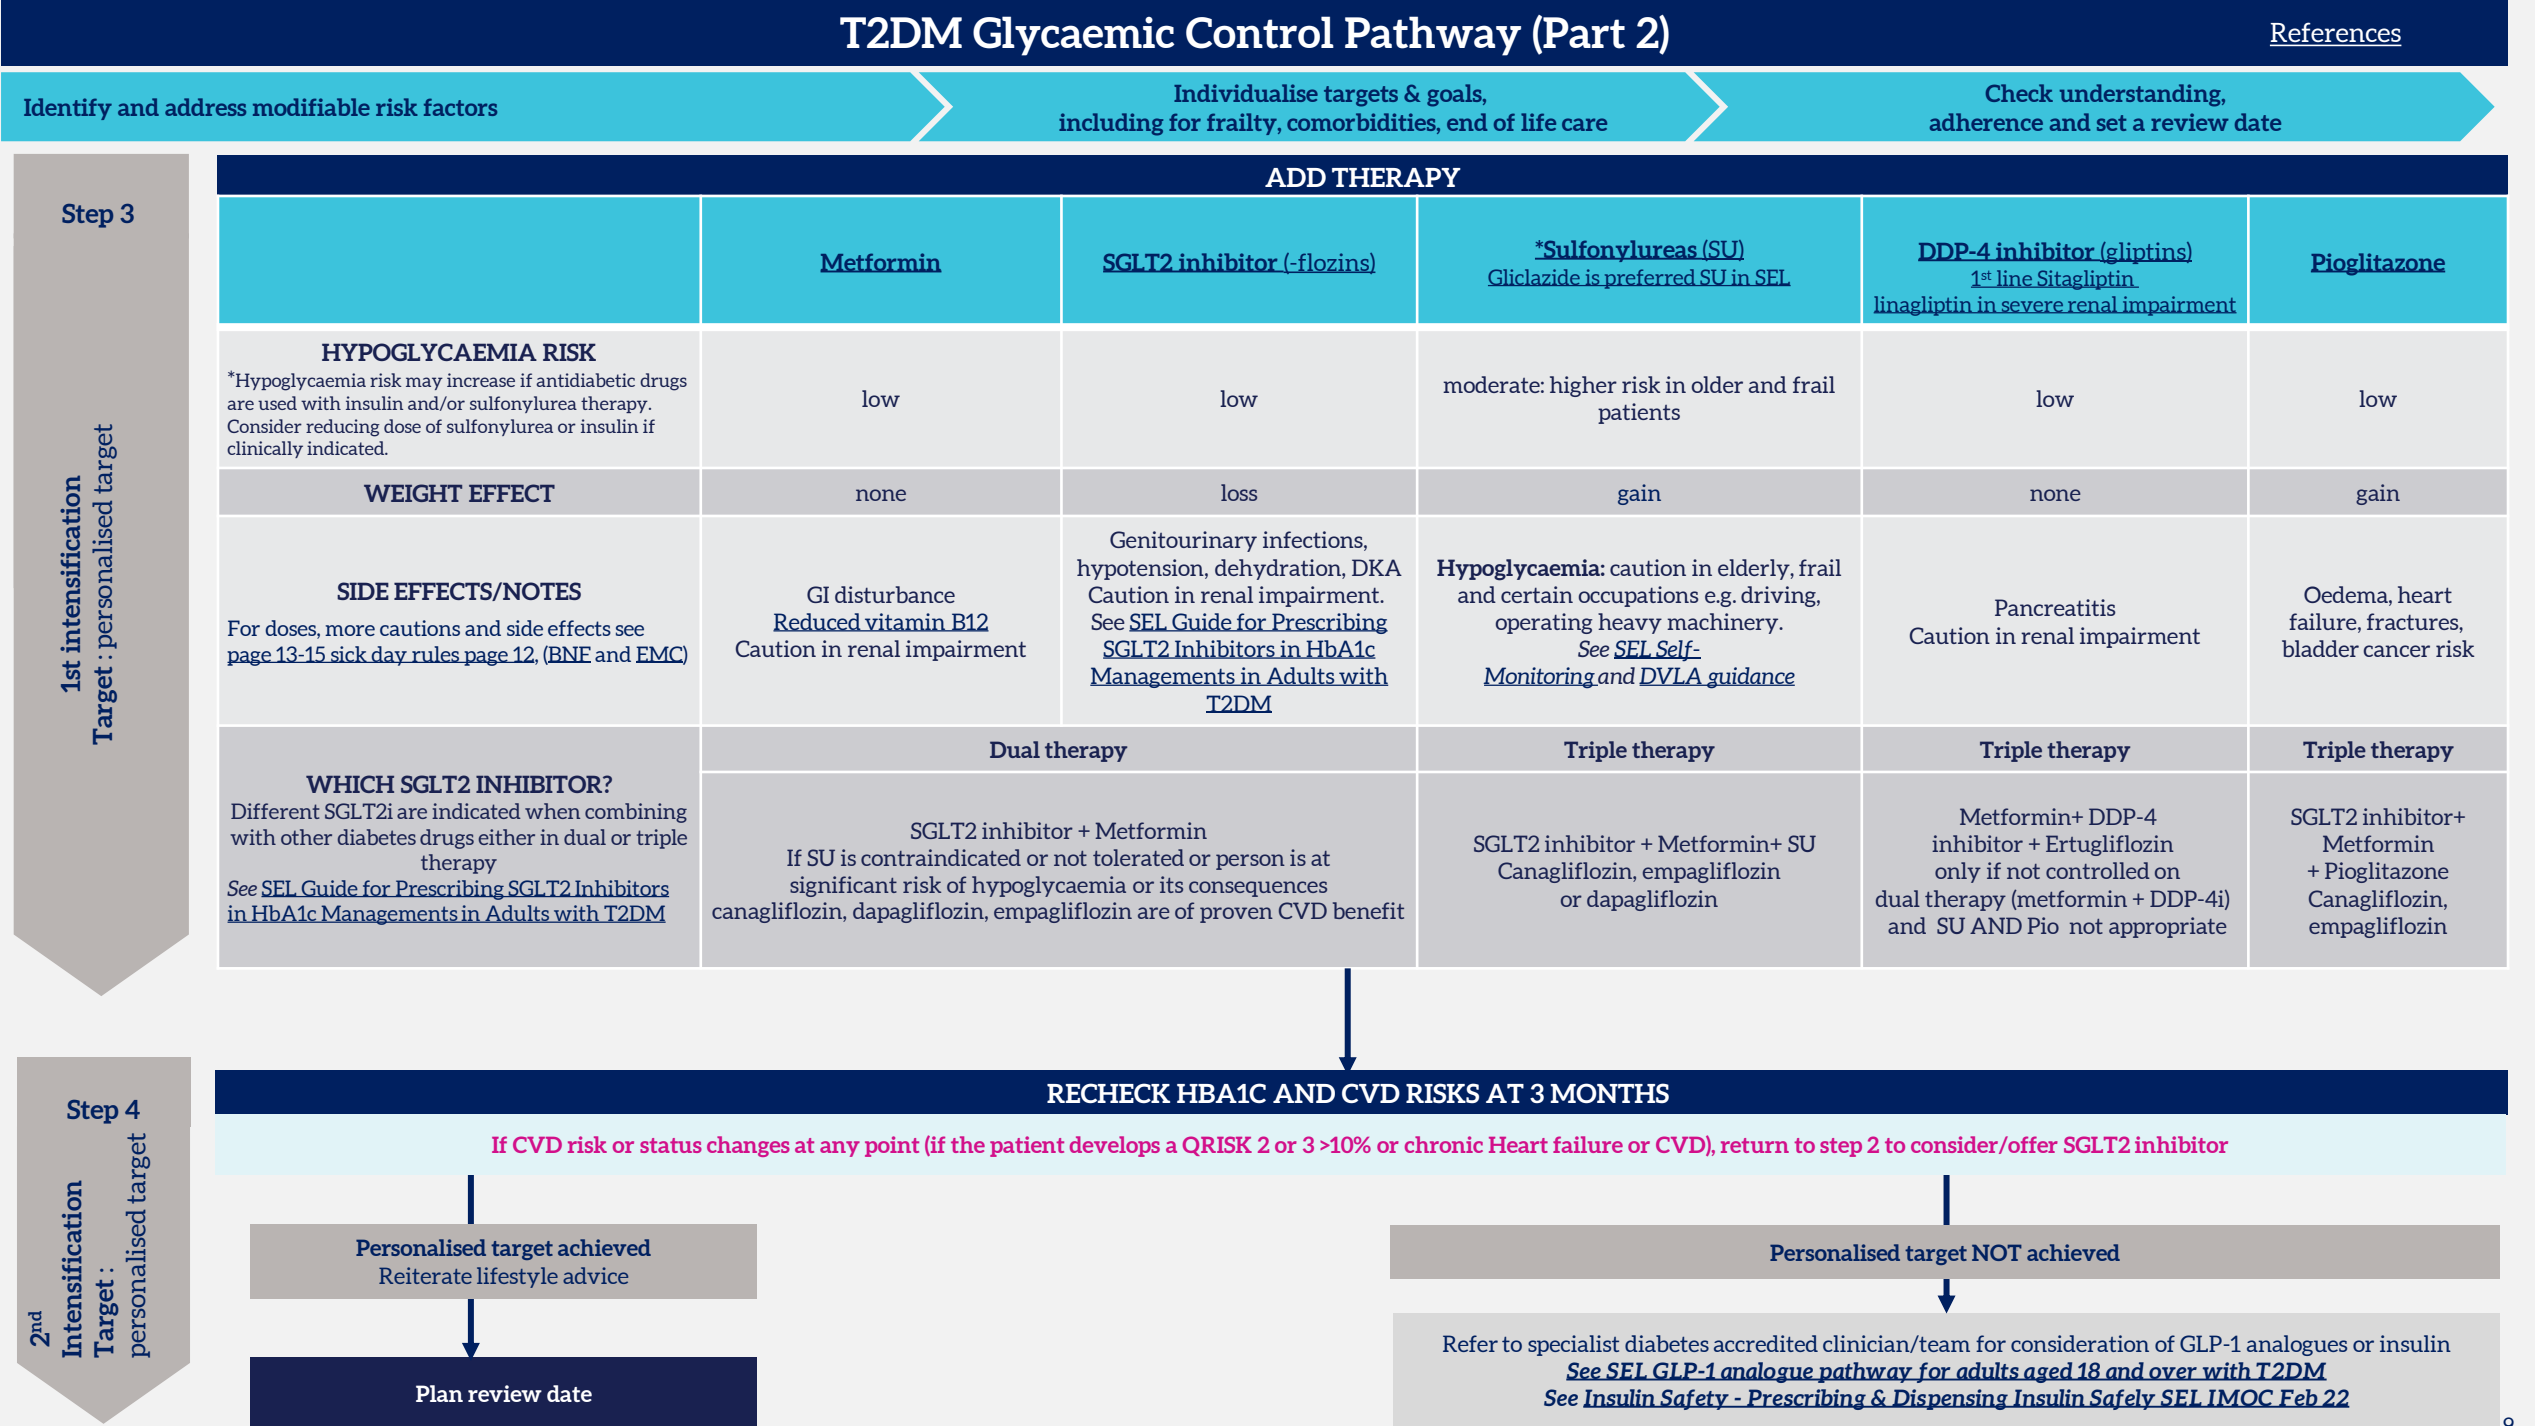

Plan review date

Personalised target NOT achieved

Move to Step 3

See the next page

Target : personalised target

Pregnancy planning is key

- There is increasing prevalence of T2DM amongst younger patients in SEL.
- Include opportunistic contraceptive advice and pregnancy planning in diabetes reviews for all women of childbearing age.
- Refer to pre-pregnancy clinic when planning pregnancy.
- Support **immediate** referral to diabetes pregnancy clinic when pregnancy confirmed. Advise seek urgent GP appointment when positive pregnancy test.

Structured education
Signpost if not already done this.

Lifestyle advice
Provide advice and support for weight management, exercise, and healthy eating. Target pre-conception BMI: $\leq 27 \text{ kg/m}^2$.

Folic acid
5mg daily pre-pregnancy and for the first 12 weeks to reduce neural tube defect risk..

**Comorbidities**

Optimise control of other conditions e.g. hypertension. Seek specialist advice for haemoglobinopathies including SCD.

**Contraception**

Offer effective contraception if not planning a pregnancy or until BMI and HbA1c are optimised.

**Mental health**

Early onset T2DM (under 40 years) is associated with increased psychological and social needs. Enquire about and address any mental health concerns.

**HbA1c**

Women should aim for an HbA1c $\leq 48 \text{ mmol/mol}$ before pregnancy and . avoid pregnancy if $\geq 86 \text{ mmol/mol}$ due to higher risks. Pre-pregnancy clinic will agree a targeted range for glucose monitoring to minimize hypo risks.

**Kidney check**

Check renal profile and urine ACR in pre-pregnancy period. Note that eGFR is unreliable during pregnancy.

**Retinopathy**

Retinopathy screening is particularly important pre-pregnancy and during pregnancy.

Diabetes medicines pre-pregnancy, pregnancy and breast feeding

Seek specialist advice on diabetes medicines pre-pregnancy and during pregnancy.

Stop teratogenic medicines before pregnancy e.g. ACE, ARB, statins.

See CESEL Hypertension Guide for safe prescribing for hypertension in pre-pregnancy/pregnancy

Useful information sources for in prescribing in pre-pregnancy, pregnancy and breastfeeding

BUMPS: Best use of medicines in pregnancy

UKTIS: UK teratology information service

Women may be asked to frequently monitor their glucose both pre pregnancy and in pregnancy. Please prescribe a good supply of lancets and test strips.

Gestational diabetes (GDM)

Risk factors for GDM

Previous GDM
BMI $\geq 30 \text{ kg/m}^2$
Previous baby $\geq 4.5 \text{ kg}$
1 st degree relative with diabetes
<u>Ethnicity with high prevalence of diabetes</u>
Glycosuria: +2 once, +1 twice
Polycystic Ovarian Syndrome

Patients with risk factors are tested in antenatal clinic with HbA1c or OGTT (oral glucose tolerance test).

Post natal period

Follow Up

Pre-pregnancy T2DM

Ensure appropriate diabetes follow-up. Pregnancy is an opportunity to offer optimal post natal and ongoing diabetes care.

GDM diagnosed in pregnancy

- Ensure GDM coded
- Remind of hyperglycaemia symptoms
- Highlight risks of recurrence in future pregnancies.
- Advise diabetes testing when planning future pregnancies
- Offer annual HbA1c screening
- Signpost to Diabetes Prevention Programme

13 weeks postnatal offer HbA1c (or fasting glucose (not OGTT))

HbA1c	or fasting glucose	Advice
<39mmol/l	<6.0mmol/l	Low probability of having diabetes Give lifestyle advice Annual check for diabetes (HbA1c)
39-47mmol/l	6.0-6.9mmol/l	High risk of developing diabetes Give lifestyle advice Annual check for diabetes (HbA1c)
$\geq 48 \text{ mmol/l}$	$\geq 7.0 \text{ mmol/l}$	Likely to have diabetes, offer confirmatory test (HbA1c)

Consider who is best in the team for each step, make maximum use of all roles

	Tasks/Activity	Where?	Tools/Support
Review planning	Call/recall planning: Use Ardens searches to prioritise for review	Remote	Ardens and <u>UCLP searches</u> available on your EMIS system Contact your <u>CESEL facilitator</u> if you need help.
Pre-patient review	Contact patient for: <ol style="list-style-type: none"> Pathology tests: renal function, FBC, lipids, HbA1c & urine ACR BP measurement: in practice, pharmacy or home monitoring Weight and height: patient may be able to provide recent home measurements for remote reviews 	Remote or Face to face (F2F)	Accurx have diabetes review Florey for pre-review information gathering - text/contact patient to encourage to complete ahead of review. <u>Share 8CP animation.</u>
Patient review	<ul style="list-style-type: none"> Ask the patient their concerns, expectations, and questions Review trend for BMI and BP Review investigations: urine ACR, renal function, HbA1c, lipid profile. Discuss risk-reduction + life-style: in context of QRISK2 or 3 and <u>Vital 5: smoking, weight, alcohol, mental health and blood pressure.</u> Medication review: any concerns with a focus on side-effects and adherence. Signpost to community pharmacy for <u>New Medicines Service</u>. Ensure renal function, HbA1c, cholesterol and BP satisfactory and adjust medications if needed. Re-calculate QRISK2/3 for primary prevention. If ≥10% discuss option of adding a statin and/or substituting an SGLT2i. If you are adding an SGLT2i consider reducing the dose of any drug that may contribute to hypos e.g. SU, especially if HbA1c is already at the agreed individual target. On initiation educate on <u>symptoms of hypoglycaemia</u> and follow up with a 3 monthly HbA1c. Share <u>patient advice leaflet - SGLT2i use for patients with diabetes.</u> Foot check examination and advice on foot care - share link via Accurx <u>Diabetes UK advice on Footcare</u> and <u>leaflets re foot risk.</u> Eye check: Check patient is receiving annual eye check ups. Driving: <u>Use Driver and Vehicle Licensing Agency (DVLA)'s Assessing fitness to drive: a guide for medical professionals.</u> Education: Signpost to <u>Diabetes Book and Learn</u> for structured education. Pregnancy planning and contraception: for women of childbearing age Complications and comorbidities: explore and manage including erectile dysfunction. 	Remote or F2F – except foot check which needs F2F	Use clinical templates: Ardens Diabetes ensures correct coding, annual review, medication review & Vital5
	<ul style="list-style-type: none"> Goal setting Self management Referral/signposting to community resources (<u>see local resources page 16</u>) 		<p>QRISK 2 or 3</p> <p>QRISK 2 and 3 are tools for estimating CVD risk. The QRISK2 calculator is integrated into EMIS, the QRISK3 Ardens template requires manual data entry. A link to QRISK3 can be found [here]. Consider using <u>lifetime QRISK</u> assessment for individuals with early-onset type 2 diabetes (under 40 years). Use QRISK estimates alongside with clinical judgment and patient preferences.</p>
Post-review	<ul style="list-style-type: none"> Follow-up plans: agreed with patient e.g. review BP monthly until it is at target, HbA1c every 3 months until at target and then 6 monthly. 	Remote or F2F	<p>Update Recall Dates: Replace existing diary entries with the updated recall date/ update review date for diabetes medication review</p> <p>Prioritise Patients: Use UCLP Priority searches in Ardens to identify high-risk patients. UCLP tools support proactive care by stratifying patients based on risk.</p> <p>Focus on Patients not achieving targets: Recall patients not meeting their diabetes care targets first.</p> <p>Work with community pharmacy colleagues for <u>BP checks</u>, lifestyle advice etc</p> <p>Contact your <u>CESEL facilitator</u> if you need help.</p>

Self-monitoring (finger prick checking)

Offer self-monitoring of blood glucose (SMBG) for patients

- On insulin
 - With history of hypoglycaemia
 - On medication that risks hypos while driving - see [DVLA guidance](#) e.g. gliclazide, insulin
 - Pregnant or planning a pregnancy
 - Treated with steroids
 - To confirm suspected hypoglycaemia
 - On specialist advice
- See [Self-monitoring of Blood Glucose \(finger prick checking\)](#) in Adults SELIMOC

[Short Diabetes UK video on how to use a blood glucose meter](#)

HbA1c mmol/mol	Average blood glucose level mmol/l
42	7.0
53	8.5
64	10.1
75	11.7
86	13.3
97	14.9
108	16.5

Average Blood Sugar Level Converter - HbA1c

Continuous glucose monitoring

SEL guidance on continuous glucose monitoring patients with T2DM can be found [here](#).

Sick Day Rules

SADMAN: Consider stopping the following drugs temporarily during a dehydrating illness, change back when better - usually after 2 days of normal eating and drinking.

- SGLT2 inhibitors
- ACE inhibitors
- Diuretics

- Metformin
- ARBs
- NSAIDs

Patient information links

[SEL Sick day guidance for patients](#)
[TREND: What to do when you are ill, patient information](#)

Insulin when unwell

Patients on insulin who are unwell should check their glucose at least four times a day and may need to adjust their insulin dose in response.

Diabetes during Ramadan

Ask patients at their annual review if they plan to fast, offer a planning appointment 2-3 months before their fast.

Develop a management plan that considers needs for SMBG, impact on driving, medication and risks.
[See Greater Glasgow and Clyde Guidelines for the Management of Diabetes Mellitus during Ramadan](#)

Hypoglycaemia

Hypoglycaemia is usually when blood glucose is below 4mmol/mol. It is a common side effect of insulin and sulphonylureas (e.g. gliclazide). Consider hypoglycaemia in patients who are acutely unwell, drowsy, unconscious, unable to co-operate, aggressive, with seizures.

Consider reducing diabetes medication in older, frail patients to reduce the risk of hypos, and agree realistic personalised HbA1c targets that do not risk hypos. Be cautious of the low/normal HbA1c in frail patients, it may alert to hypo risk and can be missed when reviewing blood tests results.

Treating hypoglycaemia

If patient is unconscious or very aggressive: arrange for emergency admission

If oral intake safe: advise quick-acting carbohydrate (e.g. 200mls of sugary drink/ 5-6 dextrose tablets/3-4 heaped teaspoons of sugar dissolved in water).

If blood glucose is still <4mmol/l after 15min then repeat the above step up to 3 times.

If still no improvement, see practice guidance on treating hypoglycaemia or British National Formulary [Quick reference hypoglycaemia guide](#)

If the person feels better then advise them to eat a small starchy snack (banana, slice of bread or 2 plain biscuits) and take usual medication - **monitor blood glucose regularly for the next 24-48 hours.**

Review possible causes of hypo and adjust medication accordingly.

Hyperglycaemia

Random blood glucose ≥ 20 mmol/l and/or HbA1c ≥ 97 mmol/mol

[Hyperglycaemia management for adults with T2DM \(excluding pregnant patients\) - urgent treatment decision tree for primary care clinical settings SELIMOC](#)

Hyperglycaemia may result in diabetic ketoacidosis (DKA) or hyperosmolar, hyperglycaemic state (HHS), though you may see a mixed picture of these two conditions. **If in doubt seek urgent specialist help.**

Symptoms of DKA: polyuria, polydipsia, weight loss, abdominal pain, diarrhoea and vomiting, breathless, lethargy, confusion, fruity breath, tachypnoea, tachycardia, shock.

Urinary or blood ketones. May have normal blood glucose levels

Symptoms of HHS: Confusion and/or drowsiness, polyuria, polydipsia, nausea, clinical dehydration,

No urinary or bloods ketones. Glucose usually ≥ 30 mmol/l

Precipitating factors: infection, inadequate insulin, new onset diabetes, physiological stress, hypothyroidism, pancreatitis, drugs e.g. corticosteroids, atypical antipsychotics, sympathomimetic drugs e.g. salbutamol

T2DM: Preferred Medication

For detailed information on individual drugs, please check: SEL Joint Medicines Formulary, [Electronic Medicines Compendium](#), [British National Formulary](#) and [SELIMOC Diabetes Guidance](#)

	Drug	Starting dose	Daily Range	Notes (these are not extensive, please refer to the latest BNF and/or SPC for further information especially titration increments/cautions/contra-indications)
Biguanide	Metformin	500mg OD	Metformin standard release Start 500mg daily with/after food and increase by 500mg every 2 weeks until on 1g BD or maximum tolerated dose	<ul style="list-style-type: none"> Maximum dose standard release: 2-2.5g daily (3g in 3 divided doses in exceptional circumstances). Maximum dose for M/R: 2g once daily with evening meal. Routine renal function at least annually, 6 monthly for those at risk of renal impairment. Review dose if eGFR is <45ml/min (also review at 60ml/min if on >2g daily). Stop/avoid if eGFR <30ml/min. Consider slow-release preparation if standard preparation causes gastrointestinal side effects. Take with meals to reduce gastrointestinal side effects. Remember sick day rules ▀ p12. Manufacturer advises patients and carers should be informed to seek urgent medical advice if symptoms of lactic acidosis e.g. dyspnoea, cramps, abdominal pain. Long term use can reduce B12 absorption – if suspicion of B12 deficiency, monitor B12 serum levels.
	<div>Do NOT adjust the estimation of glomerular filtration rate (eGFR) in people of Black African or African-Caribbean family background. NICE CKD guidance</div>			
Sulfonylureas	Gliclazide is SEL preferred sulfonylurea	40mg – 80mg daily	160mg-320 mg daily, doses over 160mg divided. Titrate every 2 weeks according to pre-meal blood glucose – 4-6mmol/L or individualised target or against 3 monthly HbA1c.	<ul style="list-style-type: none"> Inform patients of risk of adverse events/hypoglycaemia, particularly if renal impairment. Advise patients on how to manage hypoglycaemia. Self monitor according to SEL IMOC Self-monitoring of Blood Glucose (finger prick checking) in Adults and consider alternative if Group 2 driver (large lorries and buses) Consider alternative if BMI >35kg/m² Caution in use in elderly, housebound, frail and in certain occupations e.g. operating heavy machinery. Kidneys: gliclazide – use in caution with eGFR 30-60mL/min due to increased risk of hypoglycaemia. Avoid if eGFR<30mL/min. Liver: AVOID in severe hepatic impairment due to increased risk of hypoglycaemia.
DDP-4 inhibitors (gliptins)	Sitagliptin 1 st line	100mg once daily	Sitagliptin eGFR 30-44 ml/min reduce dose to 50mg OD eGFR <30 ml/min : 25mg OD See medicines.org.uk for advice on other DPP-4i and renal impairment	<ul style="list-style-type: none"> Increased risk of pancreatitis: Dipeptidylpeptidase-4 inhibitors: risk of acute pancreatitis. Patient on dual or triple therapy of DDP4 inhibitors with a SU or dual therapy with insulin may be at risk of dose related hypoglycaemia, therefore dose reduction of SU or insulin may be needed.
	Linagliptin in severe renal impairment	5mg once daily		
Pioglitazone		15-30mg once daily	Adjust according to response up to 45mg daily	<ul style="list-style-type: none"> Safety & efficacy should be reviewed every 3-6 months in continued therapy. Contraindicated in people with heart failure history, uninvestigated macroscopic haematuria, DKA, hepatic impairment or current/history of bladder cancer. Caution: risk factors for heart failure or for those at increased risk of bone fractures, risk factors for bladder cancer, concomitant use with insulin, elderly. Patient on dual or triple therapy of pioglitazone with an SU or dual therapy with insulin may be at risk of dose related hypoglycaemia, therefore dose reduction of SU or insulin may be needed.

T2DM: Preferred Medication

For detailed information on individual drugs, please check: [SEL Joint Medicines Formulary](#), [Electronic Medicines Compendium](#), [British National Formulary](#) and [SELIMOC Diabetes Guidance](#)

	Drug	Starting dose	Daily Range	
<p>SGLT2 inhibitors (flozins) See SEL guide for prescribing SGLT2 inhibitors and Electronic Medicines Compendium for hepatic impairment dosing. Note glycaemic benefit will be limited for all SGLT2 inhibitors if eGFR< 45ml/min as the glucose lowering efficacy of SGLT2 inhibitor therapy is dependent on renal function. Further glycaemic control may be required.</p> <p>Diabetes UK information for patients</p> <p>Patient advice leaflet - SGLT2i use for patients with diabetes</p>	Canagliflozin	100mg once daily	Increase to 300mg daily if tolerated and required for glycaemic control. eGFR 45-59 ml/min : max 100mg once daily eGFR <45 ml/min : not recommend for glycaemic control in T2DM	<p>Use with CAUTION in the following circumstances</p> <ul style="list-style-type: none"> - Body mass index <25kg/m2 (<23kg/m2 in South Asian people) - Person adhering to a ketogenic/low calorie/low carbohydrate diet/intermittent fasting - Recent weight loss - Potential for pregnancy - People at risk of hypotension/hypovolaemia (e.g. elderly) - People diagnosed with or at risk of frailty - Cognitive impairment or use of medicine compliance aids (may imply inadequate understanding required to follow sick day rules and take action to prevent and identify DKA) - On high dose diuretics for heart failure (may need dose adjustment, contact heart failure team for advice) - On long term or recurrent courses of steroids (either IV or oral) - Raised haematocrit - Severe hepatic impairment - Recurrent urinary tract or genital tract infections - Long duration of diabetes (generally over 10 years since diagnosis) - Person with very high HbA1c (>86mmol/mol) - Person considered at high risk of acute effects of hyperglycaemia e.g. dehydration due to non-adherence to medication - Past history of active foot disease/foot ulceration - Existing diabetes foot ulcers - Previous lower limb amputation - History of peripheral arterial disease (PAD) - Taking sulfonylureas and/or insulin - increased risk of hypoglycaemia if started on SGLT2 inhibitors if eGFR>45 ml/min - Recurrent problematic hypoglycaemia - Those with risk factors for DKA e.g. low reserve of insulin secreting cells, conditions that restrict food intake or can lead to severe dehydration, a sudden reduction in insulin or increased requirement for insulin due to illness, surgery. <p>AVOID in the following circumstances</p> <ul style="list-style-type: none"> - Age <18 years - Pregnant, breastfeeding, planning pregnancy, female in their child-bearing years and sexually active without contraception - Person with excess alcohol consumption or intravenous drug user - Hypersensitivity to active substance or excipients - Acutely unwell person (acute medical illness including COVID19, surgery or planned medical procedure) - Active foot disease or acute ischaemic limb event - Inpatient with vascular event who is not stable - Eating disorder - eGFR lower than allowed in the up-to date licensing of the medication being considered (see EMC) - Multiple pre-disposing risks for Fournier's gangrene - Clinical features of significant insulin deficiency e.g. weight loss, symptoms of hyperglycaemia - Organ transplant (unlicensed - discuss with diabetes team) - T1DM or suspected or possible T1DM - Current/past history of DKA including ketone prone T2DM - Any diagnosis or suspicion of latent autoimmune diabetes (LADA), other genetic causes of diabetes, known pancreatic disease or injury - Rapid progression to insulin (within 1 year of diagnosis) - Recent major surgery <p>Discuss risks and benefits, side effects and sick day rules</p> <p>Side effects include: Increased risk of urinary tract and genital tract infections, polyuria and polydipsia, thirst, postural dizziness, hypotension, dehydration, hypoglycaemia with insulin or SU. Uncommon but serious: DKA, Fournier's gangrene, lower limb amputation, fracture risk</p> <p>Ensure adequate understanding of:</p> <ul style="list-style-type: none"> - Routine, preventative foot care. - Importance of keeping hydrated and drinking plenty of sugar free fluids. If restricting fluid due to other conditions e.g. heart failure, please contact heart failure team for advice and guidance (unless advised to restrict fluids by healthcare professional due to kidney or heart problems or some other reason) - Minimising risk of DKA by not starting a very low carbohydrate diet or ketogenic diet without discussing with healthcare professional first - Management and prevention of hypoglycaemia
	Dapagliflozin	10mg once daily	eGFR <45 ml/min : not recommend for glycaemic control in T2DM	
	Empagliflozin	10mg once daily	eGFR ≥ 60 ml/min : increase to 25mg if tolerated and required eGFR 45-59 ml/min : Initiate with 10mg for those with T2DM and established CVD. For those already taking empagliflozin, continue with 10mg only eGFR 30-44 ml/min : For insufficiently controlled T2DM: initiate or continue with 10mg for those with T2DM and established CVD only. Further glycaemic control may be required eGFR <30 ml/min : not recommend for glycaemic control in T2DM For decompensated HFrEF (heart failure reduced ejection fraction) - See SEL guide for prescribing SGLT2 inhibitors .	
	Ertugliflozin (At the time of publication, the SGLT2 inhibitors with proven cardiovascular benefit are canagliflozin, dapagliflozin and empagliflozin.)	5mg once in the morning	eGFR>60ml/min: increase to 15mg daily if tolerated and required for glycaemic control. eGFR 45-59ml/min: do not initiate. For those already taking ertugliflozin, therapy can be continued at 5mg or titrated to 15mg daily as needed. eGFR<45ml/min: not recommended for glycaemic control in T2DM.	

T2DM: Preferred Medication

For detailed information on individual drugs, please check: [SEL Joint Medicines Formulary](#), [Electronic Medicines Compendium](#), [British National Formulary](#) and [SELIMOC Diabetes Guidance](#)

	Drug	Starting dose	Daily Range	Notes (these are not extensive, please refer to the latest BNF for further information especially titration increments/cautions/contra-indications)
ACEI	1st line Ramipril	2.5mg OD (1.25mg OD in frail/elderly patients)	2.5mg-10mg OD	<ul style="list-style-type: none"> For people of Black African or African-Caribbean family origin, use ARB instead of ACEI (as increased risk of angioedema with ACEI). Check baseline renal profile (Na/K/Cr/eGFR). Hyperkalaemia may occur, therefore close monitoring of serum potassium is required. Re-check renal profile within 2 weeks of initiation or dose increase and then at least annually. Titrate ACEI/ARB up at 2-4 weekly intervals to achieve optimal BP control. Initiation/dose titration: if Cr increases by >20% (or eGFR falls by >15%) stop ACEI and seek specialist advice. ACEI dose should only be increased if serum creatinine increases by <20% (or eGFR falls by <15%) after each dose titration and potassium <5 mmol. ACEI/ARB dose should be optimised before the addition of a second agent. Side effects: symptomatic hypotension can occur on first dosing – suggest take at night. Dry cough with ACEI, consider switch to ARB. Caution: Do not combine ACEI and ARB to treat hypertension. For diabetic nephropathy ARB of choice: losartan and irbesartan.
	2nd line Lisinopril	10mg OD	10-80mg OD (maintenance dose 20mg for hypertension)	
ARBs	Losartan	50mg OD (25mg OD if >75yrs old)	50-100mg OD	
	Candesartan	8mg OD	8mg-32mg OD	
CCBs	Amlodipine	5mg OD	5-10mg OD	<ul style="list-style-type: none"> Increase after 2-4 weeks to maximum dose of 10mg OD. Caution: Interacts with simvastatin – consider switching to atorvastatin. If amlodipine causes ankle oedema consider using a thiazide-like diuretic instead. Contraindication: unstable angina, aortic stenosis, severe hypotension. Side effects include flushing and headaches at initiation; swollen ankles especially at higher doses.
Thiazide-like diuretics	Indapamide (IR)	2.5mg OD	2.5mg OD	<ul style="list-style-type: none"> Check baseline renal profile, then after 2 weeks, then at least annually. If K < 3.5mmol/L or eGFR <25ml/min, stop indapamide and seek specialist advice.
Statin (See page 7)	Atorvastatin (alternative is rosuvastatin)	20mg OD	20-80mg OD	<ul style="list-style-type: none"> Seek specialist advice if eGFR <30ml/min, liver disease, untreated hypothyroidism, heavy drinker. CI in pregnancy, breast feeding, avoid or address contraceptive needs women of childbearing age. Advise to stop 3 months before conception. Multiple drug interactions, check BNF for advice, avoid grapefruit juice Advise patient to visit GP if they experience unexplained muscle pains. Refer to SEL IMOC Guidelines on Lipid Management
