# TREATMENT OF CHRONIC CONSTIPATION IN ADULTS (≥18 YEARS OF AGE) IN PRIMARY CARE

## Symptoms of chronic constipation

**The Rome IV diagnostic criteria** for constipation include spontaneous bowel movements occurring less than three times a week. 2 or more of the following for at least 12 weeks (not necessarily consecutive) with symptoms onset at least 6 months prior to diagnosis:

- Straining during >25% of bowel movements
- Lumpy or hard stool for >25% of defecation
- Sensation of incomplete evacuation for ≥ 25% of defecation
- Sensation of anorectal obstruction/blockage for ≥ 25%
- < 3 spontaneous bowel movements per week
- **Additional criteria**:
  - Loose stool rarely present without the use of laxatives
  - Insufficient criteria to indicate IBS

*see also Pan-London Suspected Cancer Referral Guide – Lower GI*

## Decision Tree

**Primary (idiopathic) constipation**

- Rectal and Abdominal Examination
- Gynaecological History / Examination
- Medical History (Table 1)
- Medicines (Table 2)
- Bloods: FBC, ESR, TFTs, Calcium

If "NO" to any on Table 1 and 2 (see page 2) and normal blood test results

If "YES" to any on Table 1 and 2 and/or abnormal blood test results

**Secondary constipation**

- Treat specific cause / medication
- Add appropriate laxatives
- Early referral to pelvic floor service if appropriate

### Choice of appropriate “first line” laxatives depends on SYMPTOMS

Please note some of these preparations are available over the counter for short-term, infrequent constipation caused by changes in lifestyle or diet such as inadequate hydration or exercise (Refer to Table 3 for examples in each laxative class):

- Low faecal mass → Bulk forming laxatives (e.g. ispaghula husk)
- Slow transit → Stimulant laxatives (e.g. bisacodyl)
- Pellet stool → Faecal softeners (e.g. sodium docusate)
- Hard stools → Osmotic laxatives (e.g. macrogol or lactulose)
- Obstructive or incomplete evacuation → Suppositories
- Combination therapies possible / advisable especially for secondary constipation

Good response to treatment with laxatives is defined as increase stool frequency and/or easing of stool passage and/or sensation of complete emptying, consider the use of the Bristol Stool Chart to provide an objective record of the person's stool form.

**If responding well and presenting symptoms show improvement, continue first line and review as necessary**

- **Escalating treatment**: If bowels not opened for >72 hours despite laxative treatment, escalate by increasing dose of one of more laxatives. If failing 2 laxatives for ≥3 months, consider pharmacological agent in line with NICE. If worsening symptoms at 6-8weeks, consider other pathology/ referral/ malignancy.
- **De-escalating treatment**: If bowels open ≥3 times within 24 hours, decrease dose or stop one of the laxatives
- **Stop/alter treatment**: If loose stools/diarrhoea develops

Stimulant laxative such as Senna should be used with caution at any stage of the pathway and limit the use to 2 weeks and then reassess.

**Secondary care**

- Anemia with GI symptoms
- Blood tests or examination
- Abnormal or high clinical suspicion of pathology

**Primary care**

- Rectal bleeding
- Nocturnal symptoms
- Unintentional weight loss
- Family history of bowel (or ovarian) cancer

**ALARM symptoms**

- Rectal bleeding
- Nocturnal symptoms
- Unintentional weight loss
- Family history of bowel (or ovarian) cancer

**Insufficient criteria to indicate IBS**

- Straining during >25% of bowel movements
- Lumpy or hard stool for >25% of defecation
- Sensation of incomplete evacuation for ≥ 25% of defecation
- Sensation of anorectal obstruction/blockage for ≥ 25%
- < 3 spontaneous bowel movements per week
- **Additional criteria**:
  - Loose stool rarely present without the use of laxatives
  - Insufficient criteria to indicate IBS

*see also Pan-London Suspected Cancer Referral Guide – Lower GI*

## NICE CKS

**NICE TA211** (in women) 4-week trial Prucalopride 2mg daily; (over 65 years of age 1mg daily)

If combination therapy with 2 laxatives from different classes at highest tolerated dose for at least 6 months, does not resolve symptoms

Refer to specialist for investigations if failing therapy

Approval date: April 2021
Review date: April 2023 (or sooner if evidence or practice changes)

Not to be used for commercial or marketing purposes. Strictly for use within the NHS.
Choice of appropriate ‘first line’ laxatives depends on SYMPTOMS
Features of pelvic floor disturbances: straining, digitation, incomplete evacuation, normal urge/frequency
Features of slow transit: reduced urge to defecate, bloating

Table 1: Medical conditions predisposing to constipation (refer to NICE for comprehensive list)
Depression
Diabetes mellitus
Gastrointestinal obstruction e.g. gastrointestinal carcinoma, ileus, ovarian or uterine tumours
Hypercalcaemia
Hypokalaemia
Hypothyroidism
Multiple sclerosis
Parkinson’s disease
Gynaecological prolapse e.g. post childbirth
Stroke
Spinal cord injuries or other neurological disorders, including motor neurone disease, cerebral palsy

Table 2: Common drug classes that can cause constipation (This list is not exhaustive)
1. Iron and calcium supplements
2. Antacids containing aluminum or calcium
3. Anticonvulsants
4. Analgesics
5. Tricyclic antidepressants
6. Sedating antihistamines
7. Antimuscarinics
8. Antipsychotics it is vital to recognise and treat Clozapine induced constipation actively MHRA Oct 17 Drug Safety Update: Clozapine: reminder of potentially fatal risk of intestinal obstruction, faecal impaction, and paralytic ileus
9. 5-HT antagonists
10. Diuretics
Table 3: Indications and recommendations for different classes of laxatives
(Refer to Summary of Product Characteristics for each individual laxative for additional information)

<table>

Approval date: April 2021  Review date: April 2023 (or sooner if evidence or practice changes)

Not to be used for commercial or marketing purposes. Strictly for use within the NHS

South East London Integrated Medicines Optimisation Committee (SEL IMOC). A partnership between NHS organisations in South East London: South East London Clinical Commissioning Group (covering the boroughs of Bexley/Bromley/Greenwich/ Lambeth/Lewisham and Southwark) and GSTFT/KCH / SLaM/ Oxleas NHS Foundation Trusts and Lewisham & Greenwich NHS Trust
| Osmotic laxatives (continued) | Sodium citrate (micro-enema) Refer to BNF for dosage of different brands available | 5-15 min | • Should be avoided in individuals susceptible to sodium and water retention |
| Selective serotonin 5HT4-receptor agonist Licence has been changed to include both MEN and WOMEN since Jun 2015 | ONLY after trial treatment with at least 2 laxatives from different classes, at the highest tolerated recommended doses for at least 6 months Prucalopride 2mg daily; (over 65 years of age) 1mg daily. Review and discontinue treatment if no response after 4 weeks. | 2-3 hr | • Renal impairment requiring dialysis • Intestinal perforation or obstruction • Severe inflammatory conditions of the intestinal tract e.g. Crohn's disease, ulcerative colitis, and toxic megacolon • Pregnant and breast-feeding women |
| Guanylate cyclase-C receptor agonist SEL APC Recommendation Increase intestinal fluid secretion and transit, and decreases visceral pain | 2nd line option for IBS associated with constipation if other therapies recommended by NICE for IBS have been ineffective or not tolerated Linaclotide 290mg once daily. If no improvement of symptoms after 4 weeks, the benefits and risks of continuing treatment should be reconsidered. | Immediately but symptoms improvements were seen in 1 week on clinical studies | • Gastro-intestinal obstruction • Inflammatory bowel disease |
| Peripheral antagonist of mu-opioid receptor NICE TA345 Reverse the peripheral constipatory effects of opioids | 1st line option ▼ Naldemedine Amber 1 Treatment can be initiated in primary care after a recommendation from an appropriate specialist NICE TA651 ONLY for the treatment of opioid-induced constipation (OIC) in adult patients who have previously been treated with a laxative. 200 micrograms (one tablet) daily There is no experience in patients treated for constipation induced by partial opioid mu-agonists (e.g. buprenorphine). 2nd line option ▼ Naldemedine Amber 1 Treatment can be initiated in primary care after a recommendation from an appropriate specialist NICE TA345 Reverse the peripheral constipatory effects of opioids ONLY for treatment of opioid induced constipation in adults whose constipation has not adequately responded to laxatives 25mg once daily (or starting dose of 12.5 mg for people with renal insufficiency and taking moderate CYP3A4 inhibitors [e.g. diltiazem, verapamil]. Dose can be increased to 25 mg or 12.5 mg is well tolerated by the patient) An inadequate response is defined as opioid-induced constipation symptoms of at least moderate severity in at least 1 of the 4 stool symptom domains (that is, incomplete bowel movement, hard stools, straining or false alarms) while taking at least 1 laxative class for at least 4 days during the prior 2 weeks | 2hrs | • Gastro-intestinal obstruction • Due to the limited therapeutic experience, patients with severe renal impairment should be clinically monitored when initiating therapy with naldemedine▼ • Use in patients with severe hepatic impairment is not recommended • Concomitant use with strong CYP3A4 inhibitors (e.g. clarithromycin, ketoconazole) |
|  | | <2hs | • Gastro-intestinal obstruction • Patients with cancer with certain conditions that increase the risk of GI perforation e.g. advanced ovarian cancer (see SPC for specific advice) • Concomitant use with strong CYP3A4 inhibitors (e.g. clarithromycin, ketoconazole) |
When naloxegol therapy is initiated, it is recommended that all currently used maintenance laxative therapies are stopped, until the clinical effect of naloxegol is determined.
